

Weekly Influenza Surveillance Report

Maryland Department of Health and Mental Hygiene | Infectious Disease and Environmental Health Administration
Office of Infectious Disease Epidemiology and Outbreak Response

SYNOPSIS

During the week of March 6-12 (week 10), influenza activity in Maryland was “regional”, with increased activity reported from two of five surveillance regions. Cases of influenza and hospitalizations associated with influenza were reported from all over Maryland. Two outbreaks of influenza were reported. All indicators of activity showed a decrease during week 10. However, influenza type A H3, type A H1N1, and type B continue to circulate in Maryland as shown by positive PCR tests being reported by the State Laboratories Administration.

PLEASE NOTE: Influenza is not a reportable condition in Maryland. As a result, we rely on select sources of information such as some (sentinel) clinical labs and physician offices, and the public. Because these sources cannot report all cases in the state, the counts contained in this summary do not represent the true number of cases of influenza in Maryland. They do provide valuable information about trends. All data are preliminary and subject to change.

INFLUENZA-LIKE ILLNESS SURVEILLANCE (ILINet)

During week 10, ten sentinel providers reported 173 (2.4%) of 7,087 visits to their practices were for ILI. This is below the state baseline of 5.6%.

This same week last season, when influenza activity peaked late in October of 2009 and was on the decline by December, the proportion of visits for ILI was 2.4%.

For more information on the US Outpatient Influenza-like Illness Reporting Network (ILINet), please visit our website: <http://dhmh.maryland.gov/fluwatch> and click on “ILINet Sentinel Providers”.

Figure 1. Proportion of visits for ILI to ILINet sentinel providers, 2010-11 influenza season

CLINICAL LAB REPORTS OF RAPID FLU TESTING

During week 10, 22 sentinel clinical laboratories reported 373 (13.5%) of 2,773 rapid influenza tests as positive: 236 were positive for type A, and 137 were positive for type B influenza. This proportion of positive tests was higher than the proportion reported at this time last season (2009-2010), which was 2.4%, and lower compared to the proportion observed during the peak of activity during the 2008-2009 season. While not as accurate as PCR tests, rapid influenza tests become more accurate as the flu season progresses and as influenza becomes more prevalent in the community, giving insight into the activity of influenza.

Figure 2. Proportion of positive rapid tests reported by sentinel clinical laboratories, 2010-11 influenza season

Type of Positives	Number (%)
Type A	4,634 (85%)
Type B	839 (15%)
Positive, but not typed	0
Total Positive	5,473 (100%)

MARYLAND RESIDENT INFLUENZA TRACKING SURVEY (MRITS)

During week 10, 550 (36.7% of total) participants in the MRITS responded to the weekly survey. Of those who responded, 10 (1.8%) reported flu-like illness. This proportion is slightly lower than this same week last season, when 2.1% of respondents reported flu-like illness.

We are always looking for more participants for the MRITS. If you know someone who would like to participate, please direct them to our website: <http://dhmh.maryland.gov/flusurvey>.

Figure 3. Proportion reporting ILI to the MRITS by week, 2010-11 influenza season

DHMH LABORATORIES ADMINISTRATION REPORTS

During week 10, the DHMH Laboratories Administration performed a total of 111 PCR tests for influenza. Seventy-three (73) were positive for influenza: 32 were type A (H1N1), 28 were type A (H3), and 13 were type B.

The table to the right shows the breakdown of positive tests by influenza strain for the 2010-11 influenza season to date.

More information on the valuable work done by the DHMH Laboratories Administration is available at <http://dhmh.maryland.gov/labs>.

Influenza Type	No. (%)
Type A	
H1	664 (48.5%)
H3	629 (46.0%)
Unsubtyped	0 (0%)
Type B	75 (5.5%)
TOTAL	1,368 (100%)

Table 1. Number of respiratory samples positive for influenza by PCR reported by the DHMH Labs Administration, 2010-11 influenza season

EIP INFLUENZA HOSPITALIZATION SURVEILLANCE

During week 10, 44 hospitalizations associated with influenza were reported to the Emerging Infections Program (EIP) by 40 hospitals. To date, there have been 1,070 hospitalizations.

To be a confirmed hospitalization associated with influenza, the person must be hospitalized and have a positive influenza test of any kind (rapid test, PCR, culture).

During the same week last season, 9 hospitalizations were reported, with a total of 1,423 at that point in the season. For the entire season (2009-10), 1,458 hospitalizations were reported.

DID YOU KNOW?

The Maryland House of Delegates recognized the [University of Maryland's School of Pharmacy](http://tinyurl.com/4uf5rl6) with a resolution for the School's efforts in the "Vote & Vax" campaign during Election Day 2010 in Prince George's County. Students and faculty were available to immunize voters with influenza vaccine. A total of 153 individuals took the opportunity to get vaccinated. Forty-two of them had not been vaccinated against influenza in previous seasons. (Read more at: <http://tinyurl.com/4uf5rl6>)

REPORTS OF OUTBREAKS IN INSTITUTIONAL SETTINGS

During week 10, three outbreaks of respiratory illness were reported. Two were confirmed as influenza outbreaks, and one was an outbreak of pneumonia. This brings the season's total to 65 reported outbreaks. Last season, a total of 208 outbreaks of respiratory illness were reported. Of those, 33 were confirmed as influenza outbreaks.

An outbreak of ILI is re-classified as an outbreak of influenza if there is laboratory evidence of influenza virus present in the samples collected from case-patients during the outbreak.

Figure 5. Number of outbreaks reported by week and by type during the 2010-11 influenza season.

EMERGENCY DEPARTMENT ILI REPORTS (ESSENCE)

During week 10, a total of 42,873 visits to emergency departments for all reasons were reported to the Office of Preparedness and Response through the ESSENCE system. Of those visits, 965 (2.3%) were for influenza-like illness. This proportion is in between those observed over the prior two influenza seasons and slightly lower than the previous week.

For more information on ESSENCE, please visit the Office of Preparedness and Response's web site at: <http://bioterrorism.dhmd.state.md.us>.

GOOGLE FLU TRENDS

According to Google, influenza activity in Maryland is currently **"MODERATE"**. What does this mean? From the [Google Flu Trends Website](http://www.google.com/flu): "We have found a close relationship between how many people search for flu-related topics and how many people actually have flu symptoms. Of course, not every person who searches for 'flu' is actually sick, but a pattern emerges when all the flu-related search queries are added together. We compared our query counts with traditional flu surveillance systems and found that many search queries tend to be popular exactly when flu season is happening. By counting how often we see these search queries, we can estimate how much flu is circulating in different countries and regions around the world."

Figure 7 – According to Google Flu Trends, influenza activity in Maryland is currently "moderate". At this time last year, during the 2009 H1N1 influenza pandemic, influenza activity in Maryland was "low" to "moderate".

CDC NATIONAL INFLUENZA SURVEILLANCE REPORT

<http://cdc.gov/flu/weekly>

Synopsis: During week 10 (March 6-12, 2011), influenza activity in the United States decreased.

- Of the 6,384 specimens tested by U.S. World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NREVSS) collaborating laboratories and reported to CDC/Influenza Division, 1,346 (21.1%) were positive for influenza.
- The proportion of deaths attributed to pneumonia and influenza (P&I) was at or above the epidemic threshold for the seventh consecutive week.
- Eleven influenza-associated pediatric deaths were reported bringing the season total to 71. Four of these deaths were associated with an influenza B virus, three were associated with 2009 influenza A (H1N1) viruses, two were associated with influenza A (H3N2) viruses, and two were associated with an influenza A virus for which the subtype was not determined..
- The proportion of outpatient visits for influenza-like illness (ILI) was 3.0%, which is above the national baseline of 2.5%. Eight of the 10 regions (Regions 1, 2, 4, 5, 7, 8, 9 and 10) reported ILI at or above region-specific baseline levels. Four states experienced high ILI activity; six states experienced moderate ILI activity; 11 states experienced low ILI activity; 28 states and New York City experienced minimal ILI activity, and the District of Columbia and one state had insufficient data.
- The geographic spread of influenza in 31 states was reported as widespread; 15 states reported regional influenza activity; the District of Columbia and three states reported local influenza activity; Puerto Rico, the U.S. Virgin Islands and one state reported sporadic influenza activity, and Guam reported no influenza activity.
